1.Run the demo

I have prepared basic parallax background code, simple player movement code, and scene setup for your convenience in future use within your own projects. (Should you require it, you may utilise your own code.)

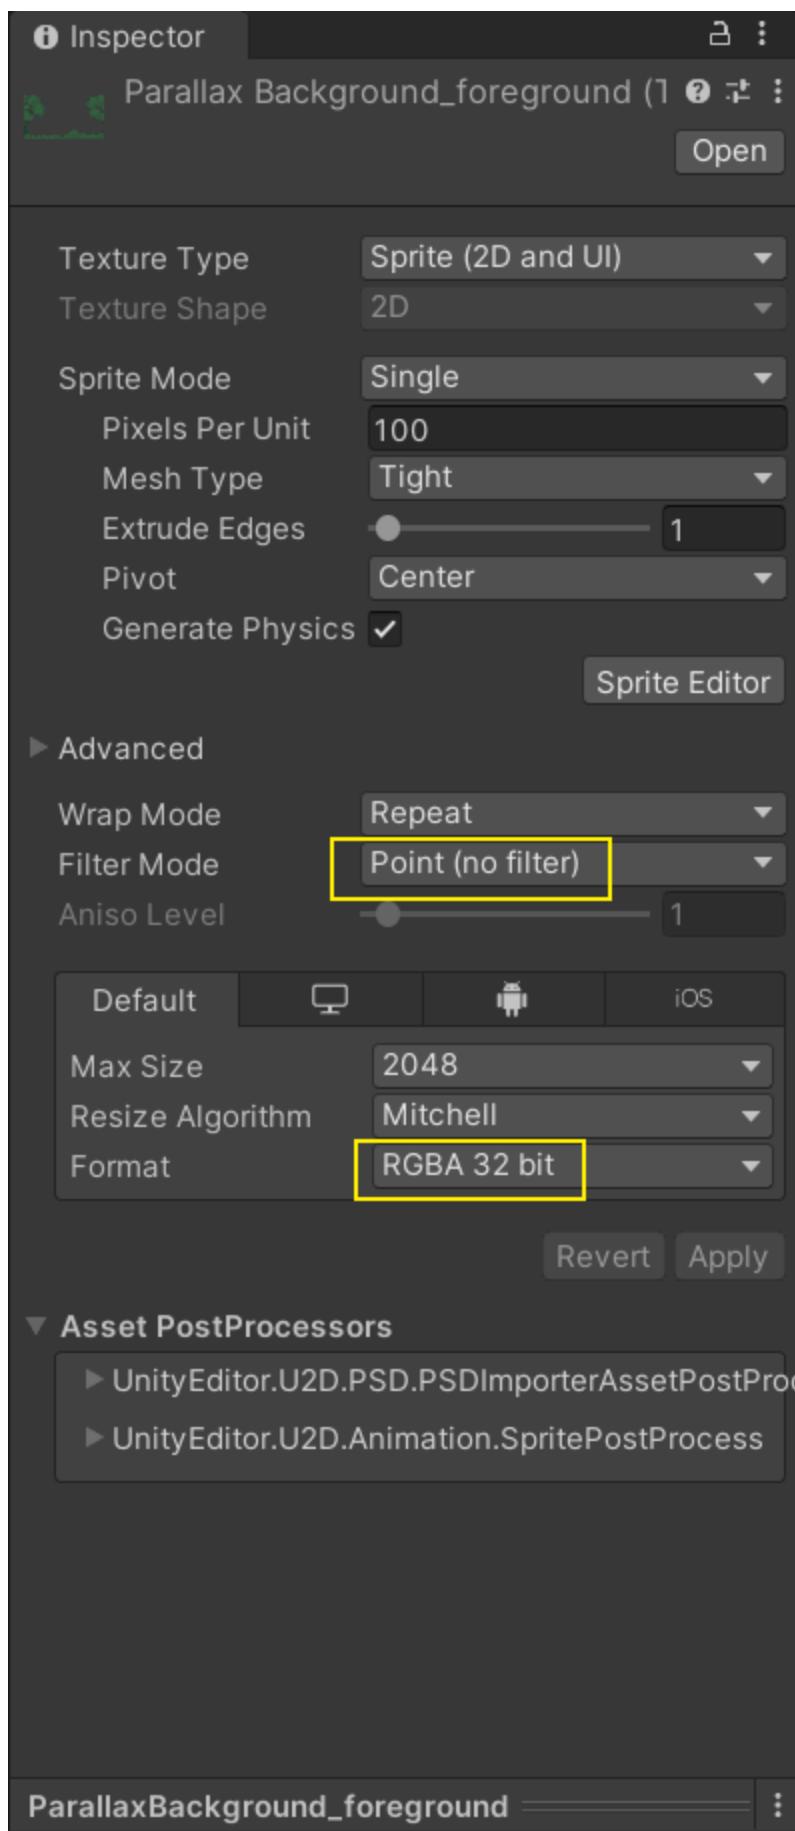

Additionally, I have employed Unity's built-in render pipeline. Should you prefer the universal render pipeline or another render pipeline, you may change it accordingly.

You may:

- Import the Unity package
- Open the Demo Scene.unity file
- Run it directly
- Additionally, you may control the A or D keys, along with the jump key, to preview the parallax background.

2.File Settings

I have configured the following settings for .png files within the project: (Should you require it, you may revert to your own settings)
